ALLERX[®]

IMMUNOTHERAPY RECOMMENDATION

AVAILABLE IN INJECTABLE AND SUBLINGUAL

The efficacy of immunotherapy will be highest when including allergen extracts deemed relevant based on exposure and seasonality of signs. An effective immunotherapy should avoid including cross-reactive allergens. The list of potential allergen extracts for immunotherapy are below. When determining allergens for immunotherapy, we advise including only those deemed clinically relevant. Allergens have been subdivided into positive, borderline, and cross-reactive categories below.

TREATMENT OPTION 1:

D. farinae **Storage Mite (Tyrophagus)**
Stable Fly **Wall Pellitory**

TREATMENT OPTION 2:

D. farinae	Cottonwood/Poplar (b)*
Stable Fly	D. pteronyssinus (b)*
Storage Mite (Tyrophagus)	Hazelnut (b)*
Wall Pellitory	Horse (b)*
Alternaria (b)*	Mosquito (b)*
American cockroach (b)*	Olive (b)*
Aspergillus (b)*	Ragweed Mix (b)*
Birch (b)*	Storage Mite (Lepidoglyphus) (b)*
Cat (b)*	Timothy (b)*

For best results, include a skincare bundle with treatment:

DERMATOLOGICAL BUNDLES

INCLUDES 2 SPOT-ON, 1 SHAMPOO & 1 MOUSSE

- Atop7 Bundle
- PYO Bundle
- Essential 6 Bundle

PAX Complete

**Wall Pellitory Par j 2**

Par j 2 is an allergen from the wall pellitory (*Parietaria judaica*); it is a member of the nsLTP allergen family. The potential for cross-reactions with most other allergens of this family is considered low. In humans, Par j 2 is a highly specific marker for pellitory pollen sensitization; at this time, it is not known if the same occurs in animals. Allergen-specific immunotherapy is recommended for lamb's quarter pollen sensitization, if the corresponding clinical signs occur.

D. farinae Der f

This patient has a sensitization to house dust mites. Associated allergic signs are generally year-round, but house dust mites are known to proliferate during times of high humidity and temperature. There is a known cross-reactivity between allergens of house dust and storage mite species, as well as between those of *Dermatophagoides farinae* and *Toxocara* spp. Allergen-specific immunotherapy is recommended for house dust mite sensitization, if the corresponding clinical signs occur.

Tyrophagus putrescentiae Tyr p 2

Tyr p 2 is an allergen from the *Tyrophagus putrescentiae* storage mite; it is a member of the mite Group 2 allergen family (MD-2-related/NPC2 intracellular cholesterol transporters). Tyr p 2 is a major allergen of humans sensitized to this house dust mite; at this time it is not known if this is also the case in animals. The potential for cross-reactions of Tyr p 2 with other Group 2 mite allergens is variable, from high with that of the other storage mites (e.g., Gly d 2) to low with Der f 2 and Der p 2. Allergen-specific immunotherapy is recommended for storage mite sensitization, if the corresponding clinical signs occur.

Apple Mal d 1

Mal d 1 is an allergen from apples (*Malus domestica*); it is a member of the PR-10 allergen family. Mal d 1 is sensitive to heat and digestion. Mal d 1 is a major allergens of humans sensitized to apples. In most cases a Mal d 1 sensitization is caused by a primary sensitization to Bet v 1 from birch pollen; at this time, we do not know if this is also the case in animals. The potential for cross-reactions between Mal d 1 and other allergens of the PR-10 family is high. Food sources containing PR-10 allergens include strawberries, hazelnuts, peanuts, soy, carrot, and celery. Allergen-specific immunotherapy is currently not available for food allergens; the best treatment currently consists on the avoidance of foodstuff containing the offending allergens.

Salmon Sal s 1

Sal s 1 is an allergen from the Atlantic salmon (*Salmo salar*); it is the beta-parvalbumin, the parvalbumin of bony fishes, and a member of the EF hand allergen family. Parvalbumins are minor allergens of humans sensitized to fish; our studies have found that this allergen family is also the target of IgE in some dogs. At this time we do not know if this is the case in cats. There is high cross-reactivity potential between fish parvalbumins. Allergen-specific immunotherapy is currently not available for food allergens; the best treatment currently consists on the avoidance of foodstuff containing the offending allergens.

Stable Fly Sto c

This patient has a sensitization to stable flies. Clinical signs are due to a combination of immediate and late-phase reactions that follow the bites of insects; signs are generally worse in the summer and fall. There is a high likelihood of cross-reactivity between salivary allergens of different biting insect species, especially those that are closely related. The avoidance of insect bites via multifaceted insect control measures is the most effective treatment option for insect bite hypersensitivity.

Premium allergy management for your four-legged loved ones

Driven by science, powered by passion

Just like humans, companion animals and horses suffer from allergies. For over 30 years, Nextmune has been committed to providing patients with allergies a higher quality of life.

let's connect   

Interpreting Food Sensitivity Results

DIET TRIAL

A diet trial is the gold-standard for determining the type of food sensitivities a patient is experiencing. A patient may be experiencing IgE-mediated sensitivities or cell-mediated sensitivities OR a combination of both. The recommended way to identify where on the spectrum the patient falls is to feed Purina Elemental or Royal Canin Ultamino exclusively for 8 weeks and then return to the original offending diet for a challenge. If the patient reacts with allergic symptoms within 24 hours, the patient has IgE-mediated disease.

NEXTMUNE'S TESTING

Patients with IgE-mediated disease should avoid the foods identified with our testing.

INTERPRETING RESULTS

Since exposure plays a role in IgE elevations, you should also categorize foods into known exposure and unknown exposure. Once you have the exposure category, then you know how to prioritize the ingredients. Our food lists treat all positives as requiring removal. However, it is important to understand that a negative without exposure may become a positive with regular exposure.

Why allergy treatment?

Allergy testing without proceeding to allergy therapy does little to improve your dog's quality of life. Allergy therapy is the **ONLY** way to increase tolerance and address the root cause of their symptoms without harsh side effects. This is accomplished by introducing their immune system to small, controlled doses of the allergens to which they've reacted.

Treatment is available in allergy drops (lasting 100 days) or allergy injections (lasting 283

days). Regardless of which method you choose, treatment sets are formulated specifically for your dog based on their allergy test results.

With compliance from both the pet parent and the veterinarian, NextmuneUS has seen improvement rates as high as 90%* – this means less reactions!

Discuss the details of your dog's treatment with your veterinarian today!

*According to a veterinary survey

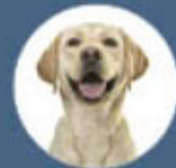

DID YOU KNOW?

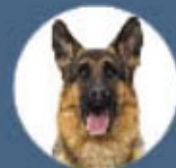

Breeds most likely to suffer from allergies...

#1: Golden Retriever

#2: Labrador Retriever

#3: German Shepherd

#4: Cocker Spaniel

#5: Boxer

Hypo-sensitization for allergy management

ALLERGY INJECTIONS

- Every other day initially & eventually once per month
- Treat up to 24 allergens per set
- Initial set lasts 283 days
- Most economical option
- Observe dog for 45 minutes after each dose

ALLERGY DROPS

- Once a day oral administration
(No food/drink 10 minutes before/after)
- Treat up to 24 allergens per set
- Initial set lasts 100 days or 150 days
- 2 pumps or 3 pumps (based on weight)
- Observe dog for 45 minutes after each dose

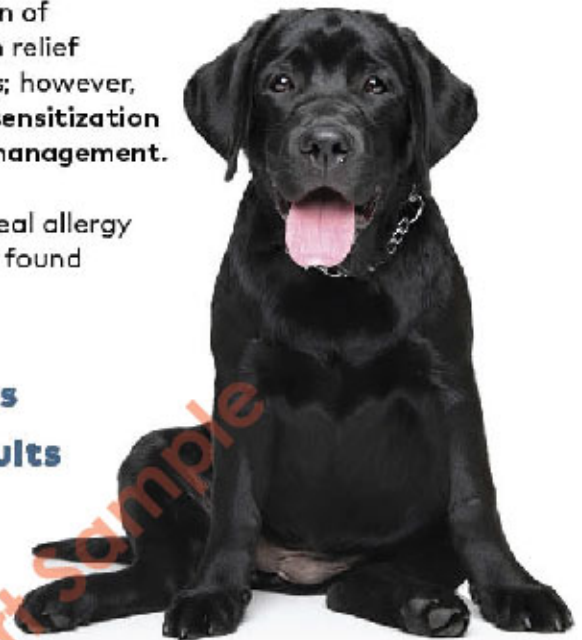

Customized Allergy Report Sample

Taking Control Of Your Dog's Allergies

Allergy symptoms can initially be managed with a combination of antihistamines, diet changes, fatty acids, shampoos, and even relief medications. Positive effects can be seen with these therapies; however, the benefits are usually limited and temporary. To date, **hyposensitization is the safest, most effective treatment for long-term allergy management.**

NextmuneUS is committed to empowering pet parents with real allergy solutions. By consistently utilizing this 3-step approach, we've found lasting relief possible for your pet.*

1. **Consistently treating all possible reactions**
2. **Modifying the diet based on your pet's results**
3. **Maintaining treatment long-term; even after symptoms subside**

DID YOU KNOW?

Relief medications like Apoquel® and Cytopoint® are helpful tools that, according to these experts, are not to be used in lieu of allergy testing/treatment...

This condition is going to require lifelong management and we are going to have to partner together to work through what the underlying cause is: infections/parasitic, food, inhalant or contact allergies, etc.

- Zoetis, makers of both Apoquel® & Cytopoint®*

We must be very cautious and emphasize the need to do a complete workup on the dog for underlying cause rather than just treating the pruritus.

- Dr. Bruce Hansen, DVM, DACVD
Dermatology & Allergy Services for Animals*

With Apoquel®, it is very clear when the antipruritic effect has worn off – it's dramatic.

- Dr. Rod Rosychuk, DVM, DACVIM - Professor of
Clinical Studies at Colorado State University*

*Canine Atopic Dermatitis: Building a Lifelong Treatment Plan, Zoetis, Clinician's Forum (Jan. 2017)
